

Study Protocol

1. Study Title

Project 60: Health Behavior and Clinical Characteristics Assessment Study

2. Background and Rationale

This study aims to evaluate demographic characteristics, health behaviors, and chronic disease indicators using structured metadata variables defined in the Project 60 data dictionary. The study supports standardized metadata collection and quality evaluation.

3. Objectives

Primary Objective: To assess the completeness and distribution of health-related variables.

Secondary Objective: To evaluate relationships between demographic variables and health behaviors.

4. Study Design

This is an observational, cross-sectional study using structured questionnaire data. Data are collected via standardized variables defined in the study data dictionary.

5. Study Population

Inclusion Criteria:

- Adults aged 18 years and older
- Completed baseline questionnaire

Exclusion Criteria:

- Missing critical demographic information
- Duplicate records

6. Variables and Data Collection

Variables include demographic information (age, sex, race), health behaviors (alcohol use, smoking, vaping), vaccination status, and chronic disease indicators. All variables follow predefined datatype, enumeration, and validation rules.

7. Data Management

Data will be stored in CSV format aligned with the data dictionary. Quality checks will evaluate completeness, validity, consistency, and uniqueness.

8. Statistical Analysis Plan

Descriptive statistics will summarize categorical variables using frequencies and percentages. Continuous variables will be summarized using means and standard deviations. Associations will be explored using chi-square tests and regression modeling where appropriate.

9. Ethical Considerations

All data are de-identified. The study follows institutional guidelines for human subjects research and ensures confidentiality and data protection.

10. Timeline

Month 1: Data preparation and quality assessment

Month 2: Statistical analysis

Month 3: Reporting and dissemination
